

Photoshop

Adobe Photoshop is a powerful application for color painting photo retouching, and image editing. It provides you to create high quality images not only for use in print and multimedia project, but also for the World Wide Web. Photoshop is the part of DTP.

Adobe Photoshop today is undeniably one of the best image editing and manipulation software. It enables you to transform your vision into reality. It helps you to create original artworks, retouch and correct images, manipulate scan images and prepare professional quality output for both print and electronic media.

Extension: .psd

- **What are the advantages of Adobe Photoshop?**

1. **It can enhance colors.** As the years pass by, colors on the traditional photo paper will start to fade. And as they fade, it decreases the clarity of the contents of the photo. If you do not like the original color in the picture, it can be altered using Photoshop.
2. **It can change the backgrounds.** When the background does not appear attractive, Photoshop has a tool that can change the background.
3. **It can create tricks.** This is the fun part. Deceitful yet wonderful tricks can be applied to the photos. For example, a person's face can be placed in a photo with pyramids to make an illusion that you've been to Egypt. Moreover, if one person was unable to be in the picture, his face can be inserted to make it appear as if he was present when the photo was taken. These things and more are included in the tools and features of Photoshop.
4. **It can make old photos look like new.** Aside from the fading colors of old photos, there are also some features that contribute to its decreasing the quality. Photoshop helps in enhancing old pictures.

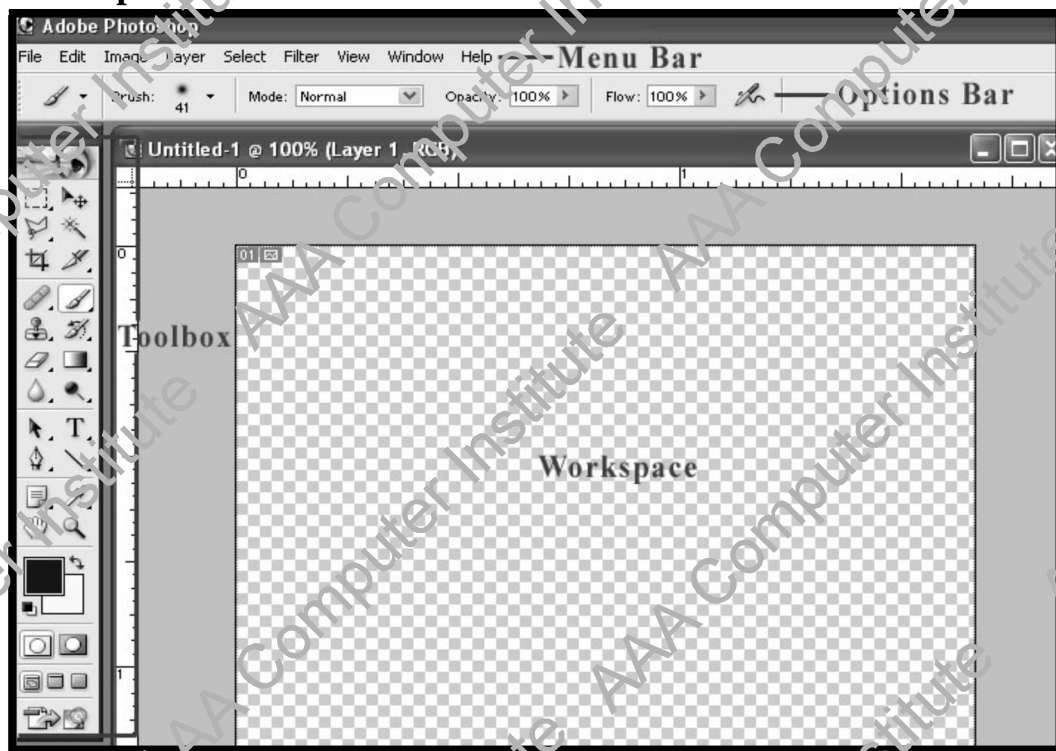

- **What are the disadvantages of Adobe Photoshop?**

One of the disadvantages of Adobe Photoshop is the fact that the photo is not entirely real. Many people argue that photographers are 'faking it' and losing the ability to take a creative or professional shot because they know they are able to fix any photo using Photoshop. You can never be entirely sure if a photographer is extremely talented at taking photographs and capturing a scene at the perfect time of day to obtain the best lighting and positioning or if the photographer has enhanced it with computer software.

Color mode:

1. **RGB:** contains a red, green and blue channel, used for the web , multimedia presentation etc
2. **CMYK:** contains a cyan magenta yellow and black channel. Used for printing full color process.
3. **Lab:** combines both RGB and CYMK colors in one.

Workspace

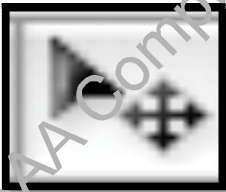

The Photoshop **Menu** displays different drop down menus for performing various tasks in Photoshop. Common options such as save or exit are available from these menus.

The Photoshop **Options Bar** changes depending on which tool you are currently using from the toolbox. Options such as brush size or opacity are a couple of common options.

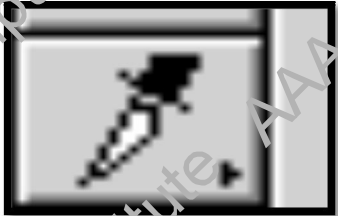

The Photoshop **Toolbox** contains all of the most commonly used tools in Photoshop. Tools such as the paintbrush, selection tool, eraser, text, etc. can all be selected from this area of Photoshop.

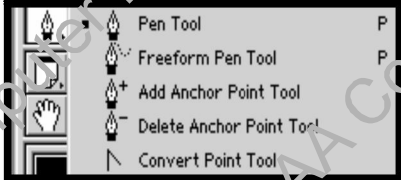

The **Workspace** is where you build your project.

Tool

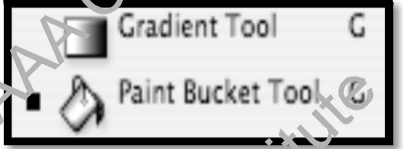

Move Tool(V)		The Move tool moves items in the document, such as selections, layers, and guides.
Marquee Tools(M)		The Marquee tool selects a section of the document based on the shape of the chosen tool. • The rectangular marquee tool will allow you to make selections in the shape of a square or rectangle. • The elliptical marquee tool will allow you to make round or oval shaped selections in your image. • The single row marquee tool is used to make a single pixel selection that is the width of your image. • The single column marquee tool is used to make a single pixel selection that is the

		height of your image. The last 2 are rarely used.
Lasso Tools(L)		The Lasso tools allow you to select a section of the document either by freehand, polygonal, or magnetic selections. • The Lasso tool will close the selection will close automatically when the mouse is unclicked. • The Polygonal lasso tool will allow you to make more precise selection. Click on the start point of the first straight segment and then click on the end point of the straight segment. • Magnetic lasso Make a selection by fastening itself to existing bitmapped line in the image.
Magic Wand Tool(W)		• The Magic Wand tool selects areas of similar colors.
Crop Tool(C)		• The Crop tool trims images.(When using Crop, the area that will be removed will be in Shadow.)

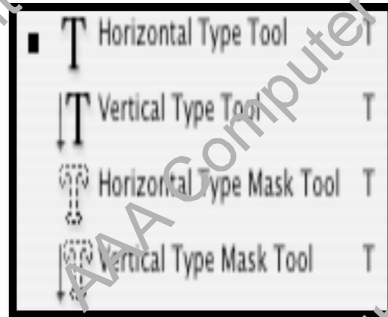

Healing Or patch Tools (J)		The Healing tools fix up issues in the document such as blemishes and red eye. • The Spot Healing Brush removes blemishes and objects. • The Red Eye tool removes the red reflection caused by a flash. • Patch tool: The Patch tool lets you repair a selected area with pixels from another area or a pattern.
Drawing Tools(B)		The Drawing tools let you draw in your document. • Brush tool: the brush tool allows you paint with the current foreground color. By default, the brush tool creates soft strokes of color. You can change the size and shape of brush in the brush tool bar at the top. • Pencil tool: the pencil tool allows you to draw a line in the pixel size that you specify.
Slice Tool(K)		• Slice Tool cuts the image into sections for web bitmap graphics

Clone Stamp or Pattern Stamp(S)		• Clone Stamp copies a selected portion of the image and recreate it on another portion of the image or on another. • The pattern stamp tool lets you paint with a pattern. You can select a pattern from the pattern libraries or create your own pattern. You select the tool and then choose your pattern from the pattern stamp toolbar.
History Brush Or Art history brush tool(Y)		• History brush tool(Y): the history brush tool works just like the brush tool except the information that it paints with is from the original state of your image. • Art history brush: the art history brush tool is the almost the same as the history brush tool only you can paint with stylizes strokes.
Pen Tool(P)		• Pen tool: this is used to draw straight line path, smoothly curved path and drawing path on an image • The Free From Pen Tool lets you draw as if you were drawing with a pencil on paper.

		Anchor points are added automatically as you draw. You do not determine where the points are positioned, but you can adjust them once the path is complete. • To Add An Anchor Point: select the add anchor point tool and position the pointer on the path where you want the anchor point added. • To Delete An Anchor Point: select the delete anchor point tool, and position the pointer on the anchor point you want deleted. • To Convert Between A Smooth Point And A Corner Point: select the convert point tool, and position the pointer over the anchor point you want changed.
Path Selection or Direct Selection Tool(A)		• Path selection tool: this tool is used to select a path component or modify. • Direct selection tool: this is used to select a path segment.

Eraser Tools(E)		• The Eraser tool will restore parts of an image to a previously saved state or will display the background color. • The Background Eraser tool will turn the erased areas into a transparency. • The Magic Eraser tool will erase everything of the same color into a transparency.
Fill Tools(G)		The Fill tools fill color into areas of the document. • The Paint Bucket tool fills in areas of similar color with the foreground color. • The Gradient Tool creates a smooth straight-line change from the foreground color to the background color. 1. The Linear Gradient 2. The Radial Gradient 3. The Angle Gradient 4. The Reflected Gradient 5. The Diamond Gradient

Text Tools(T)

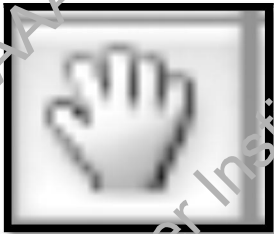

The Type tools add text to a document.

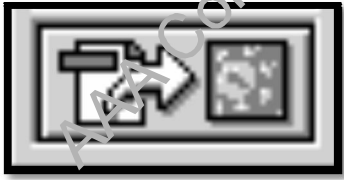

- The type tools create type on top of an image.

The type mask tools make a selection of the document in the shape of type. (Both types can be used to create text either horizontally or vertically.)

1. With the **horizontal/vertical type** tool you can type text. You can click a single point, and start typing right away. Or you can click and drag to make a bounding box of where your text goes. There are a lot of options for the type tool. You can set these options in the tools option bar at the top.
2. The **horizontal/vertical type mask tool** creates a selection outline in the shape of the letter typed. You can do anything with that outline that you can do with any other selection. Unlike the regular type tools, this one does not appear on its own layer. The type is added to the current, active layer.

Shape Tools(U)		The Shape tools draw shapes and lines in a normal layer or a Shape layer. • The Shape tools will create a solid color shape of their type. • The Line tool will create a solid color line. • The Custom Shape tool makes customized shapes selected from a custom shape list.
Blur, Sharpen or Smudge Tool(R)		• Blur tool: this tool is used to blur sharp edges in an image. • Sharpen tool: this is used to sharpen soft edges in an image. • Smudge tool: this tool is used to smudge color in an image.
Dodge, Burn or Sponge Tool(O)		• Dodge tool: this is used to lighten a portion of an image. • Burn tool: this is used to darken a portion of an image. • Sponge tool: this is used to change color saturation in the desired portion of an image

Color Picking or Measuring Tools(I)		The Color Picking and Measuring tools do not actually change the document in any way. • The Eyedropper tool changes the foreground color to the color that is clicked on. • The Color Sampler tool is an advanced tool. • The Measure tool measures the distance, location, and angle between two points in the document.
Hand Tool(H)		• The Hand tool moves an image within its window. (This is very useful when the image is naturally larger than the Window or zoomed in.)
Zoom Tool(Z)		• The Zoom tool magnifies and reduces the view of an image.
Set Foreground / Background Color		• used to set the foreground (front) and background (back) colors of an image, can also be used to change the colors of text, etc. Click on the boxes to change the colors
Edit Modes(O)		• Used to switch back and forth between modes

Switch Modes(F)	Screen		used to switch between full screen and standard screen modes
Jump to Image Ready(ctrl+shift+M)			used to easily launch the Image Ready program

Menus:

FILE MENU

New

Creates a new document.

Open

Lets you pick an existing document to open.

Browse

You can look at images before you open them in Photoshop

Open Recent:

Displays a list of recently opened documents so you can reopen them easily without digging through your hard drive.

Close

Closes the current document.

Save

Saves the current document to your hard drive.

Save As

Opens the Save As dialog box where you can save a copy of the current file with a new name or in a different file format .

Save for Web

Lets you save a copy of the current document in formats that work well with Web Browsers.

Revert

Wipes out any changes you've made to the current document and returns it to its last saved state.

Import

When you choose this menu item, Photoshop opens another menu containing options for using a scanner to get a picture, drawing, or anything else off paper and into Photoshop.

Automate

you can automate the tasks you do over and over in Photoshop by saving them as actions. This menu item lists the built-in actions that come with Photoshop.

Page Setup

Go here to choose your printer, paper size, page orientation, and so on before you print your document.

Print

Selecting this item opens the humongous Print dialog box and lets you choose things like the number of copies, print quality, and which printer you want to use. After you get the settings just right, click Print to send your document to the printer.

Print One Copy

Choose this option to make Photoshop send the current document to the printer. You normally use without giving you a chance to change any settings first. Think of Print One Copy as a quick-and-dirty way to print an image without encountering a slew of dialog boxes.

Exit

EDIT MENU

Undo

Make a mistake editing your image? Use this command to erase the last thing you did to your image.

Step Forward

If you backtrack through your image edits, you can move forward through them again by choosing this command.

Step Backward

Step Backward works just like Undo, but you can use it to go back more than one step.

Fade

This command lets you change the strength (opacity) and blend mode of the last image edit you made. It works on filters, image adjustments, and so on.

Cut

Copies the selected item to your computer's memory and deletes the original.

Copy

Copies the selected item to your computer's memory but leaves the original intact.

Copy Merged

This command makes a merged copy of all the visible layers in a selected area. If you're editing a multi-layer document, this is a handy way to quickly consolidate and copy a certain part of the image—the area you've selected—onto a single layer, without having to select that area on each individual layer.

Paste

Places objects you've copied to your computer's memory into the current document.

Paste Into

This command lets you paste one selection into another. For example, if you copy a selection and then create a selection in another document, you can use this command to make Photoshop paste the contents of that first selection into the second one, complete with a layer mask.

Clear

The Clear command deletes whatever you've selected from the active layer.

Check Spelling

If you add text to your image, this command checks for spelling errors.

Find and Replace Text

This command lets you find specific words or phrases in your document and replace them with different text if you like.

Fill

This command fills the selected area with the color of your choosing. If you haven't selected anything, it fills the whole layer instead.

Stroke

This command adds a colored stroke, or outline, to your current selection.

Free Transform

This command lets you scale, stretch, warp, distort, and rotate the selected object

Transform

Transform works like Free Transform but lets you change only one aspect of the selected object at a time. For example, you can rotate the object, but you can't scale it at the same time.

Define Brush Preset

Choose this option to convert the selected object into a custom brush.

Define Pattern

This item makes a custom pattern out of your current selection.

Define Custom Shape

This option turns the selected path or vector mask into a custom shape.

Preset Manager

You can manage groups of custom brushes, patterns, shapes, colors, and styles by selecting this menu item, which lets you edit or combine groups into new libraries and delete groups.

Color Settings

This item brings up Photoshop's advanced color settings so you can control color management and device profiles.

IMAGE MENU

Mode

This is where you change the current document's color mode and bit depth. You can choose from Bitmap, Grayscale, Duotone, Indexed Color, RGB, CMYK, Lab, and Multichannel color modes and 8-, 16-, and 32-bit images.

Adjustments

From here you can change the colors and overall tonal quality of your image...

Auto Contrast

This command adjusts the contrast between light and dark areas in your images so that highlights look brighter and shadows look darker.

.

Auto Color

Artificial lighting can skew the colors in your images, so use this command to shift them back so your image looks more natural.

Image Size

This option lets you change your image's resolution and dimensions.

Canvas Size

Choose this option to change your document's dimensions without changing its file size or resolution. Use this option if you need more space in your document but don't want to resize the elements that are already there.

Rotate canvas

Use this item's options to rotate your image and canvas. You can choose one of the presets like 180° or "90° clockwise" or choose Arbitrary and enter the number of degrees you want to rotate your image.

Crop

This command saves the area you've selected and deletes everything else, leaving you with an image that's only as big as the area you selected.

Trim

Like Crop, this command lets you cut an image down to size, but it doesn't delete the areas outside the remaining image.

Reveal All

This command shows you all the hidden elements in your image

Duplicate

This command makes a copy of your current document and lets you give the duplicated document a new name.

Apply Image

The Apply Image command lets you combine a layer and channel from one document with a layer and channel from another document using the blend mode and opacity of your choice.

Calculations

This command works a lot like Apply Image, but instead of combining layers and channels, it combines only channels.

Histogram

This panel includes a graph (called a histogram) that shows you information about the pixels in your image.

LAYER MENU

New

This command adds a layer or layer group to your image.

Duplicate Layer

This option does just what its name implies: Makes a copy of the current layer.

Delete

Choose this item when you want to delete a layer.

Layer Properties

This option lets you rename the current layer and assign it a color. It's a handy way to organize your ever-lengthening Layers panel.

Layer Style

Go here to set the blending options for the current layer and to apply effects like drop shadows, glows, and gradient overlays.

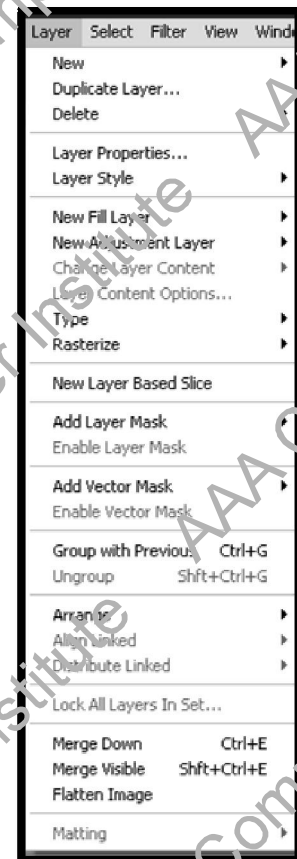

New Fill Layer

Go here to create a layer and fill it with a solid color, transparent color, or gradient.

New Adjustment Layer

This option makes a new Adjustment layer so you can apply nondestructive changes to your images.

Layer Content Options

If you need to change an Adjustment layer's settings, you can choose this command, but it's a lot faster to simply double-click the Adjustment layer in your Layers panel.

Layer Mask

From here you can show, hide, delete, and apply layer masks

Vector Mask

This option works much like Layer Mask item above, but it lets you work with vector based objects instead.

Type

This option lets you convert text to a shape, warp text, and much more.

Rasterize

This command converts text, vector-based objects, Smart Objects, shapes, 3D objects and video frames into raster-based objects.

Group with previous

Use this command to group selected layers with previous layer together.

Ungroup Layers

This command to group the grouped layer.

Arrange

This item lets you change the order of layers and layer groups in your image.

Align

This option lets you align objects that are on different layers.

Distribute

This item aligns the contents of three or more layers along the object's edges or center points.

Lock All Layers in set

This command lets you lock selected layers in a particular set so you don't accidentally edit or change them. If you select layers that aren't grouped, the menu item changes to "Lock Layers".

Merge Layers

This command combines selected layers or layer groups into a single layer.

Merge Visible

Use this command to blend all your image's visible layers into a single layer .

Flatten Image

This command merges all your image's layers into the Background layer.

SELECT MENU

All

This command grabs everything on the current layer.

Deselect

Use this command to get rid of the marching ants around a selection.

Reselect

If you didn't mean to deselect a selection, use this command to get the selection back.

Inverse

Choose this item if you select an area and want to flip-flop the selection to select the part that's not selected.

Color Range

Use this feature to grab all of the areas in your image that are similar in color to the current selection.

Modify

This option lets you tweak the edge of your current selection by expanding or shrinking it, feathering it, grabbing just its border, or smoothing it.

Grow

This command finds and grabs pixels that match the colors around the area you've Selected.

Similar

Like the Grow command, this option finds all the pixels in your image that match the selected area's colors, but it finds similar-colored pixels anywhere in your image.

Transform Selection

This command lets you resize the currently selected area with the handles of a bounding box (just like Free Transform).

Load Selection

This command lets you activate a selection you previously saved so you can use it Again.

Save Selection

Use this option to save your selection for future use.

FILTER MENU

Last Filter

This command applies the last filter you used—with the same settings—to the current layer or object.

Liquify

This filter lets you push, pull, and move pixels in all sorts of ways.

Artistic

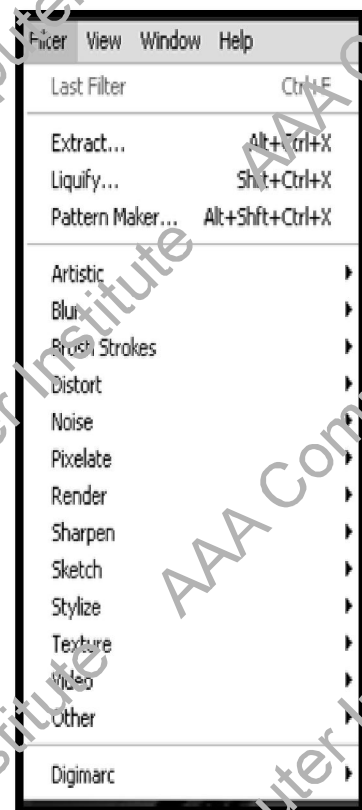

This category includes filters that make your images look like a painting or drawing.

Blur

These filters change the focus in all or part of an image.

Brush Strokes

The filters in this category make your image look like it was painted, penciled, or spray painted, among other effects..

Distort

These filters create geometric patterns based on your image, including ripple, swirl, and zigzag effects.

Noise

This category includes filters that can help smooth areas of your image that don't blend well, fix dust and scratches in photos, and remove graininess. You can also use these filters to add grain to give your image more texture and depth.

Pixelate

The Pixelate filters convert images or selections into groups of geometric shapes and patterns.

Render

These filters let you add cloud patterns, fiber patterns, and lens flares, and adjust your image's lighting.

Sharpen

You can use filters in this category to make blurry or out-of-focus images appear more clear.

Sketch

These filters let you add artistic effects to make your images look like they were hand drawn with charcoal, conté crayons, graphic pens, and so on.

Stylize

The Stylize filters do things like turn your images into collections of blocks or dots, or add a wind-blown look.

Texture

These filters make your image look like it's on a textured surface like tiles or stained glass.

Video

These filters let you deinterlace (smooth) images that you've grabbed from videos and restrict images to colors that display properly on televisions (NTSC-safe colors) in the United States.

Other

This catch-all category includes options that let you build your own custom filters and adjust the size of a layer mask, among other things.

Digimarc

These filters let you add a watermark and copyright information to your images.

VIEW MENU

Proof Setup

Use the items in this submenu to create a proof (a sample version of your image that simulates what the finished piece will look like). You can simulate how your image's colors will look on a Mac or a PC monitor or in another color mode—even how a color-blind person would see them. This preview process, called soft proofing,.

Proof Colors

This option turns soft proofing on or off.

Gamut Warning

Turn this feature on to make Photoshop highlight areas of your image that fall outside of the safe color range, or gamut, for the color mode you're working in.

Zoom In

This command works like a magnifying glass, increasing your image's magnification level.

Zoom Out

This command decreases your image's magnification level.

Fit on Screen

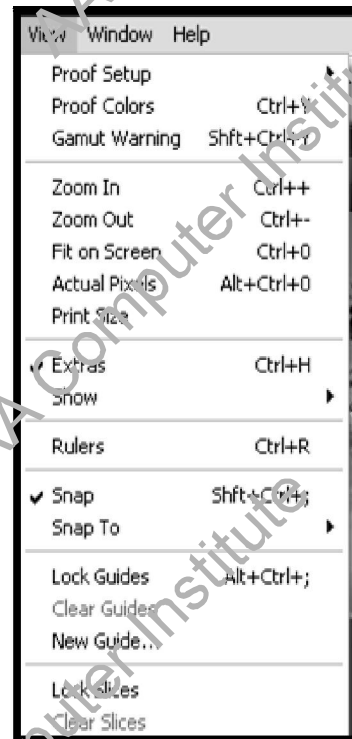

This option resizes the current image and the window it's in to fill your monitor's Screen.

Actual Pixels

Select this option to see your image at its actual size.

Print Size

This item changes the size of your image to show how big or small it will be when you print it.

Extras

With this option turned on, you can add alignment helpers like guides and grids to your images. If you use one of these features, Photoshop will automatically turn on Extras for you.

Show

This submenu lists the extra items you can display and use while you're editing your images: guides, layer edges, and more.

Rulers

This command shows or hides the horizontal and vertical rulers that run along the document window's left and top edges.

Snap

Choose this item to turn snapping on or off. (Snapping lets you align objects with guides and other items).

Snap To

Here's where you choose which items objects will snap to: guides, grids, layers, slices, document bounds, or all of those things.

Lock Guides

This command prevents you from accidentally moving guides you've added to your images. If you've already locked your guides, use this command to unlock them.

Clear Guides

Choose this option to get rid of all the guides you've added to the current document.

New Guide

This option lets you add vertical and horizontal guides to your image.

Lock Slices

Choose this item to keep slices where they are.

Clear Slices

Removes all the slices from the current image.

WINDOW MENU

Document

This submenu has commands for organizing your open document windows. From here, you can do things like open and close panels, set the same magnification level across all your documents, minimize windows, and bring all your documents in front of other windows.

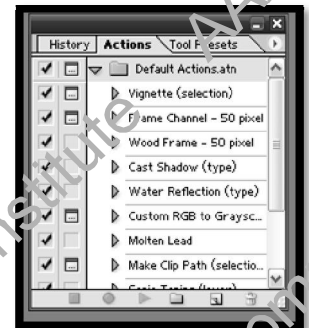

Workspace

The items in this submenu rearrange Photoshop's panels, menus, and tools to make it easier to perform certain tasks like painting or working with text.

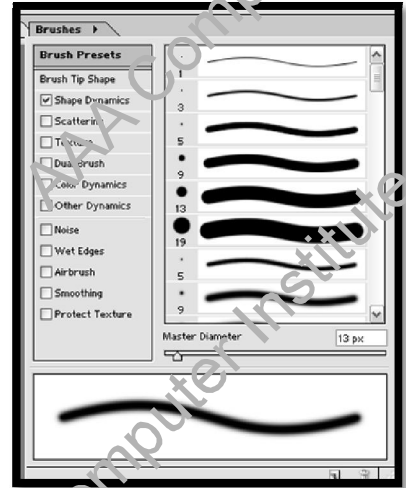

Actions

Choose this option to open the Actions panel, where you can see a list of the actions that came with Photoshop, along with those you've created yourself.

Brushes

This panel lets you select and edit Photoshop's built-in brushes, as well as brushes you've created yourself.

Channels

This panel shows the different color channels contained in your document.

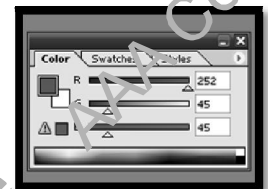

Character

The Character panel is where you can find all sorts of settings for working with text.

Color

Use this panel to view and change your foreground and background colors.

History

The History panel displays a timeline of the edits you've made to the current document.

This panel also shows what the image looked like last time you saved it and lets you restore your image to any previous state. (The History palette keeps a step-by-step record of every operation you perform in Photoshop. You can undo any number of steps by clicking on the white tab for whichever change you wish to go back to.)

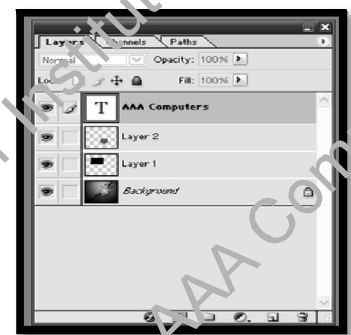

Info

This panel includes info about where your cursor is, the color of the pixels it's hovering over, and the size of your current selection (if you have one).

Layers

You can add, delete, and organize your document's layers from this panel.

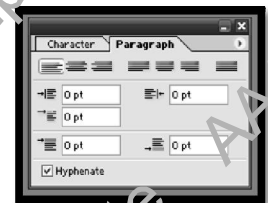

Navigator

This panel lets you change how much you're zoomed in on your image and which part of the image you're viewing.

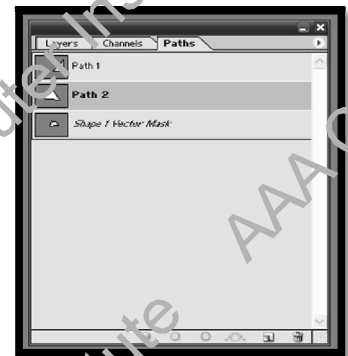

Paragraph

This panel lets you control the paragraph-wide settings for text in your documents.

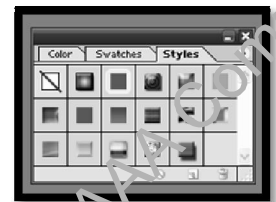

Paths

You can keep track of all the paths in your image using this panel. You can also use it to change the stacking order of the paths as well as add and delete them.

Styles

You can use this panel to apply Photoshop's built-in styles to your images as well as to create and save your own custom styles.

Swatches

Here's where you can view and pick colors from libraries of color chips.

Tool Presets

If you regularly use the same settings with a particular tool, use this panel to save them as a preset so you can use them again later.

Options

This menu item shows or hides the Options bar.

Tools

Choose this option to show or hide the Tools panel. You'll work with this panel all the time, so you'll probably want to leave it visible.

Help

If you don't know how to do something in Photoshop, you may find the answer in this menu. It includes a link to Adobe's online help system, several tutorials, and options for activating and deactivating your copy of Photoshop. You need an active Internet connection to use almost every item in this menu.

Layer

One of Photoshop's most powerful features is the ability to create and use multiple layers within the same image. A layer is nothing but a transparent plane. When you create a new image, it consists of only one layer. However, you can add as many layers as you want. You can also delete the added layers, by default, the background layer is the bottom most layer and the latest added layer is the topmost layer. When you add layers to a new image, these added layers are named layer1, layer2 and so on. If you want to make some addition to an existing image, add a new layer and make additions to that layer. In this way, you avoid the risk of spoiling the original image.

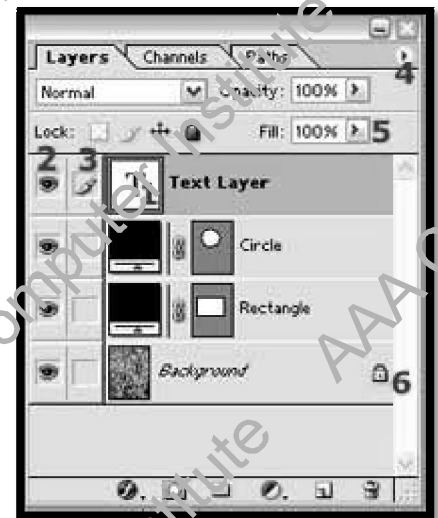

Layer Palette

Layers are most important but also very complex part of the Photoshop. To be able to use Photoshop layers you need to understand Photoshop 7 layers palette.

The Palette

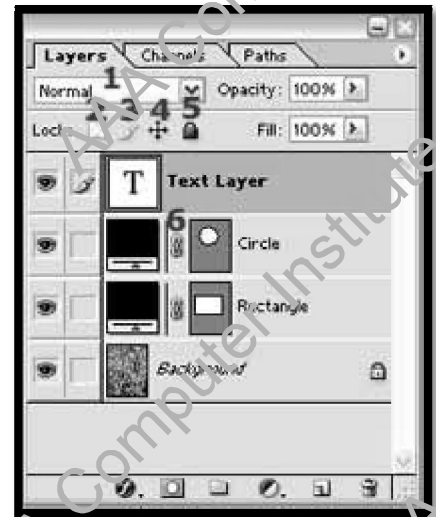

1. The **big T** in the box indicates that this layer contains text
2. The **eye symbol** indicates that the layer is visible. To make layer invisible just click on it.
3. The **pen symbol** along with the highlighting shows that this layer is active, which means that you can make changes only to this layer.
4. The **arrow in a circle** symbol leads you to detailed options of layer palette.
5. **Fill setting** has the same effect as Opacity for a Layer, except that it leaves Layer effects untouched.
6. The **padlock symbol** at the bottom right of the Background Layer entry indicates that the Background Layer cannot be moved or altered in any way, except by placing other layers on top of it.

To move layers around **click and drag the layer** you wish to move to the new position.

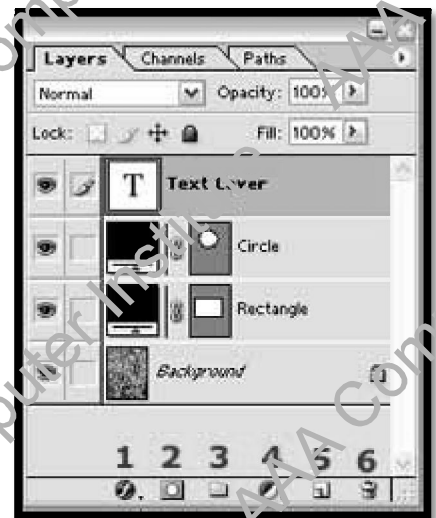

More Palettes

1. **The dropdown menu** sets the blending mode for the layer.
2. **This icon locks the transparent pixels** in the Layer to insure that any changes you make only affect those parts of the layer where there is a visible image.
3. **This icon is just opposite of the transparent one.** When clicked it ensures that any changes you make affect only transparent pixels in the layer.
4. **The cross symbol**, when clicked, lock the position of the current (active) layer in relation to the Background layer.
5. The padlock symbol locks the Layer completely, which means that you cannot make any changes to that layer unless you unlock it first.
6. **The chain symbol** indicates that the layer mask (on the right) is linked to the Layer (on the left). Double on either to bring up the options specific to each one.

Further Useful Palette Items

1. This is the button you need to **click to create new layer style** from the popup menu, which includes options such as drop shadow and glow.
2. Click this button **to add a mask to entire layer**. You can use it to add effects.
3. Click here to create a new layer set. Layer sets are used to organize and manage your layers. They work like folders. When new layer set is created you can click and drag layers to it.
4. This button is used to **create new fill or adjustment layer**. Best to use for adjusting brightness, color and so on.
5. This button is used to **create new blank layer** in the Layers palette.
6. This button **deletes active or selected layer**. You can also drag the layer to it to delete it.

Add a Layer Mask

A layer mask is added to a layer to reveal or hide an entire layer or certain portions of a layer. To hide a layer, a layer mask makes pixels transparent temporarily which can be retrieved any time in future.

Layer masks are grayscale images. They are created with painting or selection tools. Painting with white reveals, and painting with black hides, a layer. Layer masks also define various levels of transparency. If you paint the mask in gray, the layer will appear semi-transparent.

Take the following steps to create a layer mask:

Steps

Highlight the layer or background where you want to add a layer mask. Make sure that the picture is a layer otherwise you can't add a mask to it.

Use the select marquee tool and select the area which you want to reveal.

layer menu > Add Layer Mask > Reveal Selection.

After adding the layer mask, the image will look like the one given right.

Layer Styles

You can do much more with layers other than piling images on top of each other.

Once you have added images or text to a layer, you can add distinctive styles to them, making them stand out even more.

Once you've added an item to a layer (such as text), click the "Add a layer style" button in the "Layers" window. A list of styles will appear which you can add to your layer.

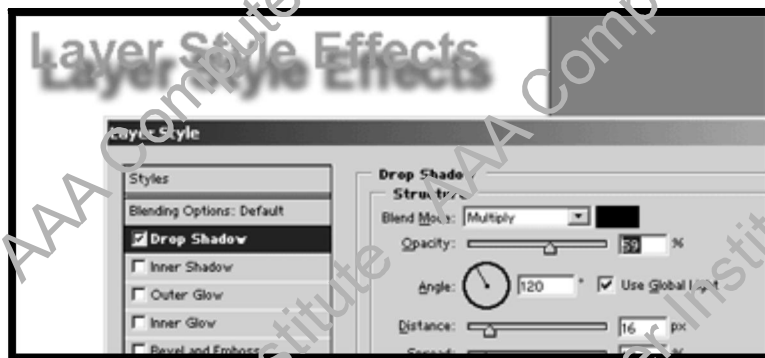

The most common layer style you will see and use is the traditional “Drop Shadow.”

Click “Drop Shadow” to bring up the “Layer Style” window, which will automatically open to the “Drop Shadow” section.

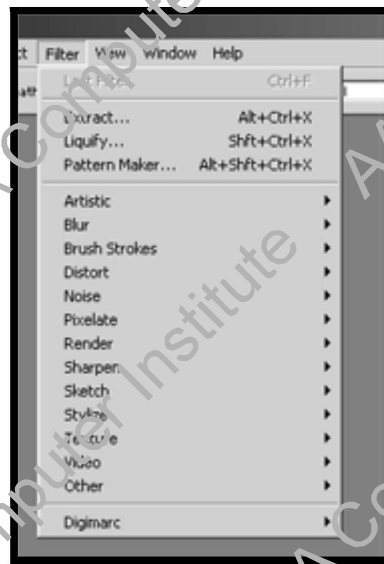

“Opacity” refers to the transparency of the shadow, “Angle” is the angle at which the imaginary light is coming from to create the shadow. “Distance” is the amount of space near or away from the object or text the shadow appears. “Spread” refers to the thickness or solidity of the shadow. “Size” is, simply, how big the shadow is. Experiment with the different settings. You’ll notice that as you adjust these settings, your image on the canvas will take on the changes. This is just a preview; none of the changes will actually take effect until you click “OK.”

There are a wide variety of layer styles. Experiment with the different layer styles to find one (or a combination of some) that suit your needs. For example, “Inner Glow” will create textures and colors within your text or objects, while “Outer Glow” will do the same outside your objects (similar to a Drop Shadow).

Filters

In Photoshop and other graphic application a filter is a particular effect that can be applied to an image or a part of an image. Filter enables us to apply automated effects to an image. Filters are applied to the active, visible layer. Filter can be fairly simply effect used to mimic traditional photographic filters are pieces of colored glass or gelatin placed over lens to absorb specific wave lengths of light of they can be complex programs used to create painterly effects. There are some effects using filter option on image which will make you clear the concept of filter and its effects.

Play around with the available filters, and remember that you can undo your actions at any time with the History window

Channel:

All documents opened in Photoshop have one or more channels. A channel records information of a specific colour (e.g. red, green). Most common are Bitmap (one channel in black on a transparent background which will give black on white if printed onto paper), RGB (three channels, Red, Green and Blue, which are overlaid to give other colours) and CMYK (four channels, Cyan, Magenta, Yellow and Black which are also overlaid to give other colours). Channels can be adjusted or switched off to create different colour effects. To switch a channel off, click the eye icon alongside the channel name in the Channel palette.

Action palate:

Actions have one basic purpose, and that is to automate processes within Photoshop 7. Each action can be thought of as a "macro," or a single instruction that performs a series of instructions. When processing photos, efficiency is the name of the game. A single action can trigger dozens of consecutive instructions, even allowing input from the user. Their real power of actions in Photoshop 7 comes from the ability to write custom actions. These actions can then be duplicated, modified, shared and saved.

Step:

1. Open any photo in the Photoshop 7 program. Locate the Actions palette within the program. If the palette is not visible, go to the "Windows" menu along the top of your program screen and select "Actions" from the list of options that appear.

2. Create a new set by clicking on the "New Set" button; this will be located at the bottom of the Actions palette. Name the set something recognizable, such as "My Actions." Click the "OK" button.
3. Click the "New Action" button, located at the bottom of the palette. Name the action something recognizable, such as "abc" then click the "Record" button. Use care as you plan the steps for correcting the photo in Photoshop 7. Each step performed will be recorded as part of the action, including if you make a mistake.
4. Select filter menu → noise → add noise
5. Select filter menu → sketch → base relief
6. Click on the "Image" menu, scroll to "Adjustments" and select "hue/saturation." In the dialog box that appears, make any setting adjustments and click "OK."
7. Perform any other commands that are necessary. Each command appears as recorded, in chronological order. Click the "Stop Recording" button (small black square) when finished. This Stop button is at the bottom of the palette.
8. Use Photoshop 7 to open a photo for editing. Select the action to be run from the Actions palette by clicking on it.
9. Click the "Play Selections" button, which is at the bottom of the Actions palette. Each step of the action will then run sequentially.

Animation:

As we know that Photoshop is not only an image editing application but it is used for web designing also. We can create web pages through it and give some animation effect which is nothing but a moving picture that we create from Photoshop and apply animation effect through image ready. There are some steps which will guide you to create an animation.

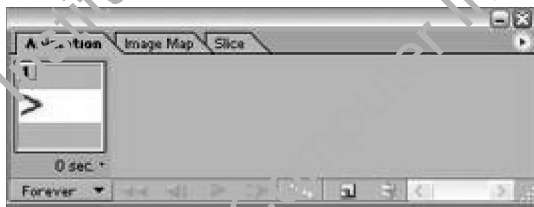

Feature:

- In an animation each frame varies slightly from the subsequent frame and this creates an illusion of movement when the frames are viewed in quick succession.

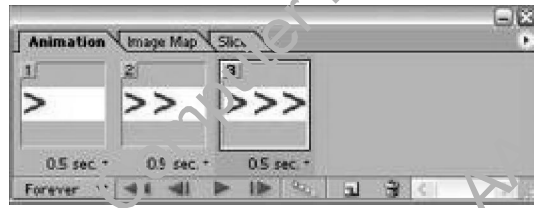

- In creating animation, working with layers is an essential part of image ready.
- If each element of an animation is placed on its own layer, it enables us to change the position and appearance of the element across a series of frames, by using the layers palette commands and options.

Steps:

1. Create a new Photoshop document and use the **Text tool** to type a > sign in your document.
2. Choose **Layer > Duplicate Layer** twice to create two copies of your text layer.
3. Move the second and third layers using the Move tool () to position them one after the other: > > > in your document.
4. Turn the visibility of the second and third layers off by clicking the eye symbol () next to the layer thumbnail in the **Layers palette**.
5. Click **Jump to Image Ready** () in the toolbox. Photoshop launches Image Ready and opens the document you just created.

6. In Image Ready you will be working with three windows – the Photoshop document, the Animation palette and the Layers palette. To begin, your animation has only one frame. Click the **Duplicate Current Frame** icon () in the Animation palette twice to add two more frames.
7. Next, you need to set the length of time each frame will play. In the **Animation** palette, look below each animation frame icon for the time measurement. Clicking and holding that measurement allows you to select from a list of times for each frame. Set the time each frame should play separately to 0.5 seconds.
8. Finally, you need to let Image Ready know what layer to display for each frame of the animation. Click on the second animation frame icon in the **Animation** palette to select it and then turn the visibility of your second text layer on in the **Layers palette**.
9. Click the third animation frame icon in the **Animation palette** to select it and then turn the visibility of your second and third text layers on in the **Layers palette**. Your Animation palette should look like this:

10. Preview your animation by clicking the **Play** button (▶) at the bottom of the **Animation palette**.
11. To save your animated GIF, click **Save Optimized** from the File menu. Image Ready opens the Save Optimized window and you can give your animated GIF a name and save it to your computer.
12. Close the document in Image Ready, and then return to Photoshop. You should save the original file in case you need to edit it later.

Background effect:

Background1	Background2
1. File menu à new à 800x500 2. Foreground color(blue) à background color(white) 3. Filter menu à render à clouds 4. Filter menu à sketch à base relief à ok 5. Filter menu à render à lens flare à ok	1. file menu à new à 800x600 2. Foreground color(dark green) à background color(light green) 3. Filter menu à render à clouds 4. Filter menu à noise à add noise à set amount à ok
Background3	Background4
1. File menu à new à 800x600 2. Foreground color(light blue) à background color(white) 3. Filter menu à render à clouds 4. Filter menu à distort à twirl à set amount à ok	1. File menu à new à 800x600 2. Foreground color(light blue) à background color(white) 3. Filter menu à render à clouds 4. Filter menu à distort à glass à set amount à ok
Background5	Background6
1. File menu à new à 800x600 2. Foreground color(light brown) à background color(dark brown) 3. Filter menu à render à clouds 4. Filter menu à distort à shear à click in graph line à drag left or right à ok	1. Start with the new background as described. 2. Go to Filter > Artistic > Sponge. 3. This example uses the following settings: Brush Size 3 Definition 17 Smoothness 7 4. Colour can be added. Go to Image > Adjustments > Hue/Saturation. 5. Check the Colorize box. 6. Adjust the Hue and Saturation sliders to give a suitable colour
Background7	Background8
1. This Photoshop background needs to start with a grey starts create a grey background as above. 2. Go to Filter > Noise > Add Noise.Set Amount to 20, Select Uniform and Monochromatic.	1. Start with a white background. 2. The Filter > Sketch menu >Water paper. set amount

OK. 3. Go to Filter > Brush Strokes > Crosshatch Stroke Length 25 Sharpness 6 Strength 2	
Background9 1. Noise can be used to make a subtle paper background. Start with a white background. 2. Go to Filter > Noise > Add Noise. 3. Set an Amount of 30. Select Uniform and Monochromatic. OK. 4. Go to Filter > Blur > Gaussian Blur and set a Radius of 2. OK	Background10 1. Start with a white background. 2. Go to Filter > Noise > Add Noise. 3. Set an Amount of 60. Check Uniform and Monochromatic. OK. 4. Go to Filter > Blur > Motion Blur. Set an Angle of 0 and a Distance of 35. OK.
Background 11 1. Start with a light grey background. 2. Go to Filter > Pixelate > Color Halftone. Choose a Radius of 40. Leave all the other settings at whatever they happen to be. OK. Playing around with the other numbers will give different results.	Background 12 1. Start with a light grey background 2. Filter > Pixelate > Pointillize. Set cell size which it wants
Background 13 1. Start with the new background. 2. Here we need a grey background. Click on the Foreground colour in the toolbox to open the Color Picker. Whatever colours are showing, the left edge of the large box is always grey. Click near the top left edge to choose a light grey. Click OK. 3. Fill the background with the grey by using Alt + Backspace. 4. Go to Filter > Artistic > Film Grain. 5. Move all 3 sliders over to the right. Click OK.	Background 14 1. Create a new file in RGB mode with a resolution of 72. 350 x 350 (pixels) and save the file. On the tools palette set your foreground color to white and background color to black. 2. Go to Filter > Render > Clouds. 3. Go to Filter > Render > Different Clouds. 4. Go 

If it is too strong, it can be toned down. - At the bottom of the Layers palette, click on the Create a new layer icon. - Go to Edit > Fill > Use: White. OK. - Hold Alt and in the Layers palette, double-click on the Backgroundlayer to turn it into a normal layer. - Drag Layer 1 to below Layer 0. - Click on Layer 0 to make it active. The top of the Layers palette has an Opacity field. Change the setting to 50%. The shortcut here is usually number key 5.	to Image > Adjust > Invert (Ctrl+I). - Go to Layer > New Adjustment Layer > Levels. - Select background layer - Go to Filter > Blur > Motion Blur. Set it to 999. I used a positive 38 degrees for the angle in this case. - Do this twice (ctrl+F) Layer > New Adjustment Layer > Colour Balance. I used setting of -63, -1, and +65 respectively with the Midtones and Preserve Luminosity Opacity switches on under the Tone Balance subheader.

Size = 6, Position=Centre, Fill Type Gradient à Click to edit gradient and select “Chrome” à Click first color stop and delete à Click second color stop and delete à Move fourth color stop to right hand side à Press OK.

10. Layer Menu à Layer Style à Bevel & Emboss à Style = Emboss, Technique = Smooth à Depth = 51% à Size = 16 à Gloss Contour = “Ring” à Press OK. 11. Select Menu à Deselect. 12. Layer Palette à Select Background layer à fill black color 13.
Effect 8
Colorful Name 1. File menu à new à RGB à ok 2. Fill black background 3. Write text in white color(aacomputers) 4. Duplicate layer(AAA computers copy) 5. Select AAA computers layer 6. Layer menu à restraize à type 7. Filter à stylize à wind and press 2 to 3 time ctrl+T 8. Image à rotate canvas à 90cw 9. Give wind from all 4 sides 10. Add new layer 11. Use Gradient dark and multi color 12. Layer mode à overlay 13. Select copy AAA Computer layer 14. Set it on the above 15. Fill color as par your choice
Effect 9
Blood effect: 1. Open new document. 2. Take new layer 3. Use pen tool to draw shape for blood. 4. Right click button of your mouse and select selection. 5. Fill color (#c10303). 6. Ctrl+D 7. Layer menu à layer style à bevel and emboss Style-inner bevel, technique-smooth, dept-201, direction-up, softern-0, angle-135, altitude-67. 8. Layer menu à Layer style à gradient overlay.(optional) Color-black and red(#c10303), liner, angle-129, scale-34
Effect 10
Rain effect in Photoshop 1. File Menu à Open à Open Image file

2. Image Menu à Duplicate Image.
3. Layer Palette à Create a new layer.
4. Toolbox à Default Foreground & Background.
5. Filter Menu à Render à Clouds.
6. Filter Menu à Noise à Add Noise à Uniform à Monochromatic à OK.
7. Filter Menu à Blur à Motion Blur à Angle = 45°, Distance = 10 pixels.
8. Layer Palette à Blending Mode à Overlay.

Effect 11

Oil effect:

1. Create a new 250x250px document
2. Fill black background
3. Choose the horizontal type tool and write text (OIL EFFECT) with white color.
Font-Bell MT, Bold
4. Place the text on the top of the canvas.
5. Layer menu à rasterize à type
6. Filter à blur à Gaussian blur(Radius-1,5)
7. Layer à duplicate layer(oil effect
8. Choose oil effect layer & press ctrl+E
9. Image menu à rotate canvas à 90cw
10. Filter à stylize à wind(stagger-On, From the right)
11. Now choose “oil effect copy layer” & create duplicate it.(oil effect copy2 layer).
12. Choose oil effect copy layer
13. Filter à stylize à wind(wind-on, from the right)
14. Ctrl+E
15. Filter à blur à blur
16. Image menu à Rotate canvas 90ccw
17. Layer menu à flatten image.
18. Filter à stylize à solarize
19. Image menu à adjustment à hue & saturation (colorize-on, hue-(47), sat(50), lig(0))

Effect 12

Freezing Ice Text Effect

1. Create a document (400 x 200 px) and fill it with black
2. Type text (“Icy” with Ariel Black at 12pt)
3. Layer menu à Rasterize Type
4. Layer menu à Merge down
5. Filter menu > Pixelate > Crystallize(3)
6. Filter menu > Blur > Gaussian Blur(1)
7. Image menu> Rotate Canvas > 90 CW:

8. Filter > Stylize > Wind(from the right) 9. Image > Rotate Canvas > 90 CCW: 10. Image > Adjustments > Hue/Saturation(Hue:215 ,Satu:50 ,Lights:0 ,Colorize: on)
Effect 13
Bubble text effect: 1. Create document 2. Fill background any dark color or(#2d3134) 3. Using horizontal type text tool and type text BUBBLE in the document with white text. 4. Set layer mode to darken 5. Layer menu à layer style à drop shadow Blending mode: multiply, black color, opacity: 15%, angle:146, dist-0, spr-0,size-13 6. Layer menu à layer style à inner shadow Blending mode: overlay, white color, opacity: 100%, nagle:146,dist-0,cho-0,size-1 7. Layer menu à layer style à inner glow Blending mode: overlay, opacity: 75%, noise: 0, white color, tech: softer, edge, cho: 0%, size: 16, rang: 50%, jitter: 0% 8. Layer menu à layer style à bevel & emboss Style: inner bevel, tech: smooth, dept: 100%, up, size: 21, sof: 0, angle: 146, highlight mode: overlay, white color, opacity: 44%, shadow mode: multiply, black color, opacity:0% 9. Layer menu à layer style à stain Blending mode: overlay, white color, opacity: 50%, angle: 19%, dist: 21, size: 13, invert, contour: Gaussian. 10. Layer menu à layer style à gradient overlay Blend mode: overlay, opacity: 45%, gradient (transparent & white), reverse, style: linear, align with layer, angle: 105, scale: 100% 11. Using the ellipse shape tool to add some bubbles surrounding the text & applying the style to them as well
Effect 14
Fire effect 1. New document and fill it with black color(800x800) 2. Layer menu à layer from background(layer1) 3. Layer menu à duplicate(layer 1 copy) 4. Write text "FIRE"(Arial black,250) with white color 5. Layer menu à restrize à type 6. Select text layer à layer menu à duplicate(fire copy) 7. Select fire layer(original) 8. Image menu à rotate canvas à 90cw

- Filter menu à stylize à wind(from left) - Apply filter 4 time - Image menu à rotate canvas à 90 ccw - Filter à blur à Gaussian blur(radius:3) - Use ctrl+E(layer copy1) - Filter menu à liquefy (brush size:80, density:11, pressure:92) - Now take the warp tool and push the streaks around to get a sort of rising "S" pattern over the letter. - Image menu à adjustment à hue/saturation(colorize: on, sat:100, hue:40) - Duplicate this colorize layer image menu à adjustment à hue/saturation(colorize:off,hue:-20) - Layer mode à overlay - Select top layer(fire copy) to make active & click on the Lock transparency icon - Fill text with gradient from yellow and brown(foreground color:#9e400,background:#a36a06) - Swipe a gradient from to the bottom across the letter.
Effect 15
Starbucks - New document 640×480(RGB) - Foreground color à black - Type text star bucks with white color (font-Candra size-63) - Ctrl + Click and select the text layer icon (select the text) - Select menu à inverse - Select menu à modify à contact(5) - Use magic wand and select the white area of the text with the use of shift key - Take a new layer - And delete text layer - Select brush and color the selection use different light color to highlight the text - Ctrl + D - Add new layer (for light effect) - Use the brush tool with opacity (50) à select leave brush - Go to brush tip shape - Adjust the diameter and spacing accounting to you - Apply the brush with different color. - On leave layer à Use outer glow or bevel and emboss as per your choice
Effect 16
Magic Effect Create a new document (7 inches ×10 inches)

2. Add background color black
3. Layer menu → add new layer
4. Take a blur brush (500px)
5. Set foreground color pink
6. Click on the center of the layer
7. Layer menu → layer style → gradient overlay → add two color (#ea00ff,#00ffea)
8. New layer
9. Foreground color pink and background color black
10. Filter menu → render → cloud
11. Layer palette → layer mode (overlay)
12. New layer select brush (9px)
13. Foreground color white
14. Use pen tool and draw a simple line
15. Select path tool → right click → stroke path → select brush → ok
16. Delete path
17. Layer menu → layer style → outer glow (spr-3,size-5)
18. Select brush tool → go to brushes (window menu)
Diameter (5), spacing (70%)
19. And draw line similar to above
20. Layer menu → layer style → outer glow V(spr-3,size-5)
21. Write text “MAGIC” with white color (font-Harlow Solid, size-70)
22. Layer menu → layer style → outer glow (spr-3, size-5)

Effect 17

Sparkling animate text

1. Open a new document
2. Select gradient tool and fill background with (#911169 to #5b1569)
3. Write text “Star” with color (#e76abf) → (font Bauhaus, size – 93)
4. Ctl + J (duplicate layer)
5. Ctl + J (duplicate layer)
6. Create a new layer on top of each of the text layer
like (star-layer 1, star copy – layer 2, star copy 2- layer 3)
7. Select star layer (text layer)
8. Filter menu → noise → add noise (20)
9. Add different amount of noise to each text layer (21,22)
10. Brush tool → select star shape
11. Place some star on top of your text (layer 1, layer 2, layer 3)
12. Hide layer
13. Click on image ready
14. Show background layer

15. Window à animation à create 3 frames
16. First word layer and first sparkle layer should be active on 1st frame
17. 2nd word layer and 2nd sparkle layer should be active on 2nd frame
18. 3rd word layer and 3rd sparkle layer should be active on 3rd frame
19. File à save optimize.

Effect 18

Thread effect

1. Take a new document (1024×768)
2. Fill red background
3. Filter menu à noise à add noise
4. Layer menu à new layer
5. Draw shape with the help of pen tool on the bottom of the layer like 
6. Fill green color in the shape
7. Filter menu à noise à add noise
8. Select brush tool à select brush shape (+ or v) and set diameter
9. Use ctrl + T for decrease the size of the shape equally
10. Select path selection
right click à stroke path
11. Text tool à write text “HARDEN” (font –Californian FB, color-black, bold)
12. Layer menu à type à create work path
13. New layer
14. Select path selection tool
15. Right click à stroke path.

Effect 19

Colorful Swirl

1. Creating new document 800*600.
2. Filter menu à render à clouds
3. Filter menu à pixelate – mezzotint (select short stroke).
4. (filter à blur à radial blur) and settings(amount-100,blur method-zoom, quality-best)
5. Ctrl+F(2 times)
6. Filter à distort à twirl with an angle of 120!
7. Layer à duplicate layer and then change the blending mode to lighten!
8. Filter à distort à twirl with an angle of -180...
9. Select layer 2 à Image menu à Adjustment à hue & sat(0,25,0 **colorize-on**)
10. Select layer 1 à Image menu à adjustment à hue & sat (202,65,0 **colorize-on**)

Effect 20
Sun effect: 1. Start a new document about 800x800 2. Create a new layer. 3. Then use the elliptical marquee tool, and while holding down shift, create a circle selection. Make the selection almost as big as your canvas. 4. Fill the selection with black. 5. Filter à Render à Difference Clouds 6. Press CTRL+F two more times. 7. Image à Adjustments à Levels ,setting(RGB ,input level-0.1,64,189) 8. Filter à Sharpen à Unsharp Mask setting Amount: 500%, Radius: 3.0, Threshold: 15 9. Filter à Distort à Spherize: Amount: 100% 10. Filter à Distort à Spherize Amount: 50% 11. Image à Adjustments à Color Balance Apply the following color levels: Shadows: +100 0 -100 Midtones: +100 0 -100 Highlights: +70 0 -15 12. Select background layer and fill black color
Greeting 1 Greeting 1. New document size (640×480) 2. Gradient tool and color on background 3. Add new layer à go to custom shape and draw heart shape with pink color 4. Duplicate layer and add bending option by right click on the layer à drop shadow (angle =120, distance=10, size 5) 5. Then go to bevel and emboss (style =emboss size = 5,soften=5, tech=smooth, angle=120) 6. Copy layer style and paste in duplicate layer 7. Draw a line with help of pen tool round the heart shape 8. And outer glow effect from layer style 9. Add outer glow effect from layer style 10. Add new layer à write text à select text and go to edit define brush à make brush of text 11. Add brush to the new layer in diagonal shape (through brush angle covering half

layer
12. Layer opacity =70

Greeting 2

Turn your photo's into greeting card

1. Open image file
2. Create duplicate image
3. Select duplicate image and transform (Ctrl +T) and resize (small with original)
4. Set in center
5. Select background image (original image)
